

Detailed Use Case Design Document Of AI Use Cases for Digital Centers

Project: AI Use Case Design and High-Level Prototype for Digital Centers of the Future, UNDP Bangladesh

Prepared By:

To
Maha Emier,
International Project Manager,
UNDP Bangladesh,
Dhaka, Bangladesh.

Subject: Submission of AI Use Case Landscape & Prioritization Report for Design and Prototyping of AI Use Cases for Digital Centers for Operational Efficiencies

Dear Sir,

As part of our engagement to design and prototype AI use cases for Digital Centers under the project “AI Use Case Design and High-Level Prototype for Digital Centers of the Future,” we hereby submit the AI Use Case Landscape & Prioritization Report for your kind perusal. This report builds on the Inception Report submitted on 01 March 2026 and has been prepared to ensure a clear and common understanding with a2i and UNDP Bangladesh regarding:

- AI Opportunity Mapping based on findings of the Baseline Assessment Report for DSC 2.0 Pilot (May 2026) along with field visits (UDC Tetuljhora & CDC Pallabi) and the DC 2.0 Co-Design Workshop.
- Landscape of twelve (12) concrete, context-specific AI use cases
- Prioritization results using the four frameworks (Eisenhower Matrix, Value vs Effort/ Complexity Matrix, Weighted Scoring Model, and Stage-Gate Readiness Funnel)
- Recommended shortlist of four (4) high-impact use cases for immediate detailed design and high-level prototyping

This report is intended solely for sharing information with a2i and UNDP Bangladesh.

We appreciate the continued cooperation and assistance provided by a2i and UNDP Bangladesh during the preparation of this report. If you have any questions or require a presentation of the findings, please feel free to contact us.

I, the undersigned, certify that I am duly authorized to sign this Report.

Name: **Hafez Ahmed**
Title: **Director & COO**

Journey C: Payment Pending
45

Journey D: Delayed Service
45

Journey E: Proactive Status Communication
45

5. Summary of AI Use Cases

5.1. Use Case 1: AI-Assisted Citizen KYC, CRM and Document Vault for Assisted Service Delivery

Purpose

This use case supports citizen onboarding, assisted KYC, consent management, document collection, document reuse, and service readiness. It helps entrepreneurs prepare citizens properly before service submission.

Problem

Citizens often do not know what documents are required for a service. Entrepreneurs repeatedly collect the same documents, manually check them, and may submit incomplete applications. This leads to rejection, delay, repeated visits, and frustration.

AI Augmentation

AI can:

- identify the citizen's service intent;
- match the citizen with an existing profile;
- suggest required documents for the selected service;
- read and extract key information from uploaded documents;
- classify documents into a secure vault;
- flag missing, blurry, mismatched, expired, or duplicate documents;
- link family members such as child, parent, guardian, or dependent;
- assess whether the citizen is ready to apply;
- pre-fill draft service cases using approved profile and document data;
- generate a simple Bangla preparation confirmation message.

Human Control Point

The entrepreneur remains responsible for:

- confirming identity;
- recording consent;
- checking document accuracy;
- approving document labels;
- confirming family relationship;
- submitting the final application.

Key Prototype Screens

- Citizen profile search

Assisted-service consent
Document checklist
Document scan/upload
Document vault
Service readiness check
Draft service case
Citizen preparation message

Example AI-in-Action Label

AI Service Readiness: “All required documents are complete. Citizens are ready to proceed with the application.”

5.2. Use Case 2: AI Service Status, Payment Tracking and Citizen Update Agent

Purpose

This use case helps entrepreneurs track application status, payment status, transaction references, reconciliation, follow-up needs, escalation, and citizen communication.

Problem

Entrepreneurs operate in a many-to-many environment. They serve many citizens while interacting with many external service systems. Each system may have separate portals, credentials, tracking numbers, payment processes, transaction references, status formats, and response timelines. Citizens repeatedly visit or call the center to ask whether their application or payment has been confirmed.

AI Augmentation

AI can:

- match citizen queries to the correct service case;
- interpret technical service status;
- interpret payment status such as unpaid, pending, paid, failed, refunded, disputed, or unreconciled;
- detect delayed applications;
- flag failed payments or payment-pending cases;
- detect possible duplicate payments;
- explain official fees, approved service charges, and total payable;
- draft simple Bangla updates for citizens;
- recommend next follow-up date;
- suggest escalation when cases are overdue;
- summarize case, payment, and communication history.

Human Control Point

The entrepreneur remains responsible for:

- confirming the correct case;
- verifying payment evidence;
- reviewing messages before sending;
- approving escalation;
- updating official case status only when evidence is available.

Key Prototype Screens

- Main dashboard
- Service register
- Case detail
- Payment tracking
- AI message generator

Guided manual status check
Escalation queue

Payment Data Boundary

The service register may store:

- official service fee;
- approved service charge;
- total amount payable;
- payment status;
- payment channel;
- payment provider;
- transaction ID;
- receipt number;
- payment date;
- reconciliation status;
- refund or dispute status;
- payment confirmation message history.

The service register must not store:

- card numbers;
- PINs;
- OTPs;
- MFS PINs;
- bank passwords;
- portal passwords;
- full financial credentials.

Safe Principle

The registry should track payment evidence and payment status, not become a wallet or financial credential store.

Use Case 3: AI Service Knowledge and Communication Assistant for Citizens and Entrepreneurs

Purpose

This use case provides service guidance to citizens and entrepreneurs in simple, understandable language.

Problem

Entrepreneurs must remember service requirements, eligibility, documents, fees, timelines, and procedures across many services. Citizens often arrive without correct documents or misunderstand fees and timelines.

AI Augmentation

AI can:

- answer questions about service requirements;
- provide citizen-specific document checklists;
- explain eligibility criteria;
- explain official fee and approved service charge separately;
- simplify government language into plain Bangla;
- prepare SMS, WhatsApp, voice-script, chatbot, or printed guidance;
- support entrepreneurs in explaining the next step.

Human Control Point

The entrepreneur confirms service rules, especially where rules may change or where local agency interpretation matters.

Key Prototype Screens

- Service knowledge search
- Service eligibility guide
- Fee explanation card
- Document checklist generator
- Citizen communication preview

Example AI-in-Action Label

AI Fee Explanation: “Government fee: BDT 100. Approved service charge: BDT 50. Total payable: BDT 150.”

Use Case 4: Predictive Service Demand and Queue Optimization

Purpose

This use case helps centers manage appointments, service demand, queues, delays, and proactive citizen communication.

Problem

Digital Centers may face unpredictable demand, long waiting times, peak-day congestion, missed appointments, and repeated citizen visits.

AI Augmentation

AI can:

- predict high-demand days and peak service hours;
- recommend appointment slots;
- estimate waiting time;

- prioritize vulnerable citizens or urgent cases;
- suggest service bundling where citizens can complete multiple services in one visit;
- send appointment reminders;
- send delay notifications through WhatsApp, SMS, chatbot, or voice channel;
- recommend rescheduling where service delay is likely.

Human Control Point

The entrepreneur confirms appointments, handles exceptions, and manually prioritizes vulnerable citizens where needed.

Key Prototype Screens

- Appointment calendar
- Queue dashboard
- AI demand forecast
- Delay notification generator
- Citizen appointment confirmation
- Manual override option

Example AI-in-Action Label

AI Queue Forecast: “Tomorrow morning is likely to be crowded due to land service demand. Recommend afternoon appointments for non-urgent cases.”

Use Case 5: AI Dashboard and Early Warning System for Center Performance

Purpose

This use case supports a2i, LGD, supervisors, and local officials to monitor Digital Center performance and identify centers needing support.

Problem

Performance issues are often detected late. Reporting is manual, inconsistent, and activity-heavy. Supervisors may not know which centers are struggling, which services are delayed, or which issues are affecting citizen trust.

AI Augmentation

AI can:

- monitor service volume, uptime, delays, complaints, payment issues, feedback, and center activity;
- detect early warning signs;
- identify centers with repeated unresolved cases;
- group issues by center, service, agency, or geography;

- generate short management summaries;
- recommend support actions such as coaching, technical support, connectivity review, or business model support;
- flag centers where citizen communication is weak.

Human Control Point

Supervisors validate AI insights before administrative action is taken.

Key Prototype Screens

- Supervisor dashboard
- Center performance profile
- Early warning alerts
- Issue trend analysis
- Recommended support actions
- Field validation tracker

Example AI-in-Action Label

AI Early Warning: “Center 027 has rising payment disputes and low citizen update rate. Supervisor review recommended.”

Use Case 6: Center Segmentation and Maturity Classification System

Purpose

This use case classifies Digital Centers into maturity levels, star ratings, or A/B/C categories so that support, incentives, and capacity building can be better targeted.

Problem

Centers are not all the same. Some are high-performing, some need business support, some need infrastructure support, and some serve difficult inclusion contexts. A generic support model does not work.

AI Augmentation

AI can:

- classify centers based on performance, service quality, financial sustainability, inclusion, uptime, feedback, and compliance;
- identify center archetypes;
- recommend training, mentoring, equipment support, or supervision;
- compare centers with similar context rather than unfair national averages;
- track maturity progression;
- recommend eligibility for recognition or incentive programs;
- explain why a center received a particular rating.

Human Control Point

Final rating, recognition, incentives, and administrative decisions remain with the authorized committee or supervisory authority.

Key Prototype Screens

- Center maturity dashboard
- Rating profile
- Evidence checklist
- Recommended improvement plan
- Incentive eligibility view
- Human validation workflow

Example AI-in-Action Label

AI Classification: “This center is categorized as Level 2: Basic Digital Service Center. Main gaps: payment recording, citizen feedback, and uptime.”

Use Case 7: Citizen Feedback and Integrity Analysis Engine

Purpose

This use case collects and analyzes citizen feedback, complaints, satisfaction, service quality signals, and integrity concerns.

Problem

Citizen feedback is often collected but not converted into actionable insights. Complaints about delay, unclear fees, unofficial charges, poor behavior, or payment confusion may remain isolated.

AI Augmentation

AI can:

- classify feedback by topic such as fee, delay, document, payment, behavior, accessibility, or service quality;
- detect sentiment in simple Bangla or short citizen comments;
- summarize citizen voice by center, service, or location;
- detect repeated complaints;
- flag possible integrity concerns;
- generate action recommendations for supervisors;
- prepare monthly citizen feedback briefs.

Human Control Point

Supervisors must review serious complaints and validate evidence before taking action.

Key Prototype Screens

- Citizen feedback intake
- Feedback theme dashboard

Complaint classification
Integrity signal alert
Citizen voice summary
Action tracker

Example AI-in-Action Label

AI Feedback Theme: “Most complaints this week relate to unclear payment charges and delayed updates.”

Use Case 8: Fraud Detection and Anomaly Monitoring for Sensitive Services

Purpose

This use case helps supervisors identify unusual patterns in sensitive services, documents, payments, complaints, or transactions.

Problem

Irregularities are difficult to detect manually across thousands of centers, many services, and many payment channels. However, risk detection must be handled carefully to avoid unfair accusations.

AI Augmentation

AI can:

- detect unusual payment patterns;
- flag possible duplicate applications or duplicate payments;
- identify cases missing receipts or transaction references;
- detect repeated disputes from the same center;
- compare service charge patterns across similar centers;
- connect payment, receipt, service status, and complaint records;
- generate risk alerts for supervisor review.

Human Control Point

AI only flags possible risk. It does not determine guilt, fraud, punishment, or final action.

Governance Language

Use careful terms such as:

- possible anomaly;
- risk flag;
- requires review;
- evidence available;
- supervisor verification needed.

Avoid using AI-generated labels such as “fraud confirmed.”

Key Prototype Screens

- Anomaly dashboard
- Risk flag detail
- Evidence view
- Center comparison
- Supervisor review workflow
- Audit trail

Example AI-in-Action Label

AI Risk Flag: “Possible duplicate payment detected. Same citizen, same service, same amount, two transactions within 10 minutes. Review required.”

Use Case 9: AI Business Sustainability and Entrepreneur Advisory System

Purpose

This use case helps entrepreneurs improve revenue, service mix, cost management, customer relationship, and business sustainability.

Problem

Many entrepreneurs lack practical tools for tracking revenue, understanding profitable services, managing costs, identifying local demand, and improving financial sustainability.

AI Augmentation

AI can:

- analyze service volume and revenue trends;
- identify high-demand and low-demand services;
- suggest new service opportunities based on local context;
- highlight cost pressure;
- recommend service diversification;
- compare performance with similar centers;
- generate simple business improvement tips;
- support coaching and mentoring.

Human Control Point

Entrepreneurs decide which business actions to take. Recommendations must not encourage unofficial charges or exclusion of low-income citizens.

Key Prototype Screens

- Entrepreneur business dashboard
- Revenue and service mix view
- AI business tips
- Cost and income tracker
- Service opportunity list
- Coaching plan

Example AI-in-Action Label

AI Business Tip: “Utility payment and school admission support are increasing in this area. Consider preparing service bundles for the next month.”

Use Case 10: Personalized Financial Inclusion Recommender

Purpose

This use case helps citizens and entrepreneurs identify potentially relevant financial inclusion services such as agent banking, savings, microinsurance, remittance support, or MSME services.

Problem

Citizens may not know which financial services are available or suitable. However, financial recommendation carries risk if handled carelessly.

AI Augmentation

AI can:

- identify possible financial inclusion needs;
- explain financial service options in simple language;
- show neutral comparison between approved providers;
- provide basic eligibility pre-check;
- warn about costs, repayment obligations, and risks;
- recommend referral to authorized financial service providers;
- support entrepreneurs in explaining options responsibly.

Human Control Point

AI should not make final financial advice, push a product, or create pressure to buy. Citizen choice and regulatory compliance are essential.

Key Prototype Screens

- Financial needs profile
- Approved product information
- Simple comparison view
- Citizen consent screen
- Referral record
- Risk and disclaimer message

Example AI-in-Action Label

AI Financial Inclusion Support: “This may be a relevant savings option. Please review details with the authorized provider before deciding.”

Use Case 11: AI-Assisted Offline and Low-Connectivity Support System

Purpose

This use case supports Digital Centers in areas where connectivity is weak or unstable.

Problem

When the internet is unstable, entrepreneurs may not be able to submit applications, verify payments, or check status. Citizens may misunderstand whether a case has actually been submitted.

AI Augmentation

AI can:

- simplify offline data capture;
- save cases as offline drafts;
- mark cases as pending sync;
- check missing fields before synchronization;
- warn that payment is not yet verified;
- prioritize urgent cases when connectivity returns;
- flag unsynced or duplicate drafts;
- generate citizen messages explaining the delay.

Human Control Point

The entrepreneur confirms data, syncs when possible, submits officially, and only marks the case as submitted after portal confirmation.

Key Prototype Screens

- Offline mode
- Draft case form
- Sync queue
- Missing field alert
- Payment verification warning
- Citizen delay message
- Supervisor offline monitoring

Example AI-in-Action Label

AI Offline Warning: “This case is saved as draft only. It has not yet been officially submitted.”

10. Prototype Design Rule

Every AI intervention in the prototype should answer five questions:

1. What did AI observe?
2. What did AI infer?
3. What does AI suggest?
4. What must humans approve?
5. What happens if AI is wrong?

Example for payment pending:

Question	Example
----------	---------

What did AI observe?	Payment status pending for 26 hours; citizen reported deduction.
What did AI infer?	Possible payment confirmation delay.
What does AI suggest?	Recheck provider and escalate if unresolved.
What must humans approve?	Escalation and citizen message.
What if AI is wrong?	Keep evidence trail and verify with the payment provider.

11. Priority for prototype

The 11 use cases should not be piloted equally in the first phase. We will only prototype 2 AI use cases to test its user experiences. They should be prioritized based on practical value, feasibility, governance sensitivity, and data readiness.

Priority 1: Proposed prototype of Use Cases

Use Case	Reason
1. AI Service Knowledge and Communication Assistant	Easy to prototype and directly useful for entrepreneurs and citizens.
2. Citizen Feedback and Integrity Analysis Engine	Directly linked to citizen trust, feedback loops, and accountability.
3. AI Service Status, Payment Tracking and Citizen Update Agent	Solves daily pain points around status, payment, and citizen communication.

13. Proposed User Journeys

Below is an updated version of the **competing user journeys**, with **AI intervention clearly articulated at each important step**.

Journey 1: Standard Happy Path

Service Submitted → Payment Successful → Citizen Updated → Service Completed

Scenario: A citizen visits the Digital Center for birth registration correction.

Step	User Action	AI Intervention	Human Decision Control
1	The citizen visits the Digital Center and requests a service.	AI can help the entrepreneur identify the correct service based on citizen intent.	The entrepreneur confirms the correct service.
2	An entrepreneur searches or creates a citizen profile	AI checks whether a similar citizen profile or previous case already exists	The entrepreneur confirms the citizen record.
3	The entrepreneur selects the service.	AI shows required documents, official fee, expected timeline, and communication risks.	The entrepreneur verifies service details with citizens.
4	Entrepreneur records assisted-service consent.	AI suggests the correct consent type based on who is receiving assistance	Citizens or authorized assistants give consent
5	The entrepreneur submits an application in the service portal.	AI reminds entrepreneurs what information must be captured in the service register.	The entrepreneur completes the official submission.
6	Entrepreneur records tracking number.	AI validates whether the tracking number format looks correct.	The entrepreneur saves the case.
7	Citizens make payment through EkPay / MFS bank / card.	AI records payment status, transaction reference, and checks if payment required for case completion.	Entrepreneur confirms payment evidence.
8	Payment is successful.	AI generates a simple Bang payment confirmation message.	Entrepreneur reviews and sends messages.
9	Case enters follow-up queue.	AI recommends the next follow-up date based on the service timeline.	Entrepreneur accepts or adjusts follow-up date.
10	Service is completed.	AI generates completion message and asks whether feedback should be collected.	The entrepreneur closes the case after confirmation.

AI-in-action moments

- AI service selection support
- AI duplicate profile/case check
- AI fee and document guidance
- AI tracking-number validation
- AI payment confirmation message
- AI follow-up scheduling
- AI completion and feedback prompt

Journey 2: Payment Pending Journey

Payment Attempted → Money Possibly Deducted → Payment Not Confirmed

Scenario: Citizen says payment was made, but the system still shows payment pending.

Step	User Action	AI Intervention	Human Decision / Control
1	Citizens call or visit the center.	AI detects the query as a payment-status issue.	Entrepreneur opens the case.
2	Entrepreneur searches by phone, transaction ID, or case ID.	AI matches the citizen query to the most likely case.	The entrepreneur confirms the correct case.
3	The case shows payment status as “Pending.”	AI interprets the payment status and explains what it means.	The entrepreneur checks payment evidence.
4	The citizen says money was deducted.	AI flags the case as “payment pending with reported deduction.”	Entrepreneurs record citizen statements.
5	Entrepreneur checks payment provider status.	If an API is available, AI retrieves the latest status; if not, AI launches guided manual checking.	Entrepreneur verifies using authorized process.
6	Payment remains unresolved.	AI recommends the next action: wait, verify again, or escalate after a defined timeline.	An entrepreneur chooses action.
7	Citizens need updates.	AI generates Bangla messages: payment is being verified.	Entrepreneur reviews and sends.
8	Supervisor monitoring.	AI adds the case to the unresolved pending payment list.	Supervisor monitors if delay continues.

AI-in-action moments

- AI intent recognition: payment query
- AI case matching
- AI payment-status interpretation
- AI guided manual verification
- AI next-action recommendation
- AI citizen message generation
- AI supervisor alert

Yes. For the **first use case — AI-Assisted Citizen KYC, CRM and Document Vault for Assisted Service Delivery** — one strong **comparing user journey** would be:

Comparing User Journey: Assisted Citizen Onboarding, KYC and Document Reuse

Journey Title

Citizen Onboarding → Assisted KYC → Document Vault → Service Readiness

Why this journey is useful for comparison

This journey comes **before** the payment/status journey. It shows how the Digital Center can prepare the citizen properly before service submission. The second use case tracks **what happens after submission and payment**, while this first use case ensures the citizen profile, consent, documents, and eligibility are ready **before submission**.

Journey 1A: Assisted KYC and Document Vault Journey

Scenario:

A mother visits the Digital Center to apply for **Class One school registration** for her child. She needs support because she is not sure which documents are required.

Step-by-Step Journey with AI Intervention

Step	User / Entrepreneur Action	AI Intervention	Human Review / Decision
1	Citizen visits the Digital Center and explains the need: “I want to register my child for Class One.”	AI detects the citizen’s intent: school admission / class one registration .	The entrepreneur confirms the service request.
2	An entrepreneur searches for an existing citizen profile using phone number, NID, or previous case.	AI checks whether the citizen already has a profile and previous document records.	Entrepreneur confirms correct citizen profile.
3	If no profile exists, the entrepreneur creates a citizen profile.	AI suggests required profile fields: citizen name, phone, NID reference, family relationship, child details.	Entrepreneur verifies with citizens.
4	Entrepreneur selects assisted service mode.	AI asks whether the citizen is applying for herself, her child, or another dependent.	Citizen confirms relationship.

5	Entrepreneur records consent.	AI suggests consent scope document storage, service application, future reuse, update sharing.	Citizens give consent; entrepreneurs record it.
6	AI shows required documents for Class One registration.	AI lists documents: child birth registration, parent NID, address proof if required, previous school record if applicable.	Entrepreneur confirms local school-specific requirements.
7	Citizens provide documents physically or digitally.	AI scans/reads documents where possible and extracts key fields.	Entrepreneurs check accuracy.
8	AI checks document completeness.	AI flags missing, expired, mismatched, unreadable, or duplicate documents.	The entrepreneur asks citizen to correct or provide missing documents.
9	Entrepreneur uploads documents to document vault.	AI classifies and tags documents: Birth Certificate, Parent NID, Address Proof, Photo.	Entrepreneur approves document labels.
10	AI creates a reusable citizen profile and family linkage.	AI links a child to a parent/guardian profile for future services.	The entrepreneur confirms the relationship and saves a profile.
11	AI checks service readiness.	AI says: “Ready to apply” or “Not ready — missing child birth registration certificate.”	The entrepreneur proceeds only when ready.
12	AI prepares a draft service case.	AI pre-fills form fields from stored documents and profile data.	Entrepreneur reviews before submission.
13	Citizens receive preparation confirmation.	AI generates simple Bangla messages: documents received, case ready for submission, next step explained.	Entrepreneurs send messages.
14	The service case is transferred to the second use case journey.	AI passes citizen profile, document references, consent record, and readiness status to the Service Status and Payment Tracking Agent.	Entrepreneur submits when appropriate.

AI-in-Action Moments

AI Intervention	What It Does
Intent recognition	Understands that the citizen wants school registration for Class One
Citizen profile matching	Finds existing citizen or family records
Assisted-service guidance	Identifies whether citizen is acting for self, child, parent, or another person
Consent recommendation	Suggests correct consent scope for assisted service and document reuse
Document requirement guidance	Shows documents needed for the selected service
Document reading / extraction	Extracts key fields from uploaded documents
Completeness check	Detects missing, unreadable, mismatched, or duplicated documents
Document classification	Labels documents correctly in the vault
Family linkage	Connects child, parent, guardian, or dependent records
Service readiness scoring	Tells entrepreneur whether the citizen is ready to submit
Draft pre-filling	Uses saved profile and document data to prepare the service case
Citizen message generation	Creates simple Bangla update for the citizen

Comparison with Use Case 2 Journey

Area	Use Case 1: KYC, CRM and Document Vault	Use Case 2: Service Status, Payment Tracking and Citizen Update
Main purpose	Prepare the citizen and document before service submission	Track the service and payment after submission
Main user	Entrepreneur assisting citizen onboarding	Entrepreneur managing submitted case
Main citizen problem solved	"I don't know what documents I need"	"I don't know what happened to my application or payment"
Key AI role	Identify service need, check documents, prepare profile	Track status, payment, delay, dispute and updates
Main data object	Citizen profile, consent record, document vault	Service case, payment status, communication history
Main risk reduced	Wrong/incomplete application	Payment confusion, delayed service, repeated visits
Output	Citizen is ready to apply	Citizen is kept informed until completion
Handover point	Creates a ready-to-submit service case	Takes over after submission/payment begins

Journey 3: Failed Payment Journey

Payment Failed → Application Incomplete → Retry or Escalate

Scenario: Payment fails during application submission.

Step	User Action	AI Intervention	Human Decision / Control
1	The entrepreneur prepares the service case.	AI confirms whether payment is mandatory before submission.	Entrepreneur proceeds to payment.
2	Citizens attempt payment.	AI monitors payment results.	Payment provider returns result.

3	Payment fails.	AI marks payment as "Failed" and application as "Incomplete / Not submitted."	The entrepreneur confirms that the application should not be marked as submitted.
4	The citizen asks what happened.	AI explains the failed payment in simple language.	Entrepreneurs explain to citizens.
5	Citizens decide whether to retry.	AI warns about possible duplicate attempts if retry is too quick.	Entrepreneur confirms retry with citizen.
6	Retry succeeds or fails again.	AI updates payment history and generates appropriate messages.	The entrepreneur sends updates.
7	If money is deducted despite failure.	AI recommends opening a dispute record.	Entrepreneurs create disputes after checking evidence.

AI-in-action moments

- AI payment requirement check
- AI failed-payment interpretation
- AI incomplete-application warning
- AI duplicate retry warning
- AI Bangla explanation
- AI dispute recommendation

Journey 4: Duplicate Payment Risk Journey

Same Citizen → Same Service → Multiple Transactions

Scenario: A citizen accidentally pays twice for the same service.

Step	User Action	AI Intervention	Human Decision / Control
1	Citizens make more than one payment attempt.	AI compares citizen, service, amount, payment time, and transaction IDs.	System flags risk, not final decision.
2	An AI alert appears on the dashboard.	AI says: "Possible duplicate payment detected."	Entrepreneur opens alert.
3	Entrepreneur reviews payment records.	AI shows why it flagged the case: same citizen, same service, same amount, short time gap.	Entrepreneur verifies with citizen and receipt.
4	One payment is valid, one may be duplicate.	AI recommends marking a second transaction as duplicate risk.	Entrepreneur records dispute/refund request.
5	Citizens need explanation.	AI generates Bangla messages explaining that the duplicate payment is being checked.	Entrepreneur sends after review.
6	The supervisor sees the case.	AI adds it to the duplicate payment risk queue.	Supervisor monitors resolution.

AI-in-action moments

- AI anomaly detection
- AI duplicate transaction flag
- AI explanation of risk reason
- AI refund/dispute recommendation
- AI citizen update generation
- AI supervisor risk visibility

Journey 5: Delayed Service Journey

Application Submitted → Timeline Missed → Escalation Needed

Scenario: Application is submitted, but expected completion date has passed.

Step	User Action	AI Intervention	Human Decision / Control
1	The case remains active in the register.	AI compares current date with expected completion date.	No manual checking needed initially.
2	Timeline is missed.	AI marks the case as “Delayed.”	Entrepreneur reviews case.
3	Entrepreneur checks the latest status.	AI retrieves API status where available, or guides manual portal check.	Entrepreneur verifies status.
4	No agency update found.	AI recommends escalation based on delay rules.	The entrepreneur decides whether to escalate.
5	Citizens need updates.	AI generates delay notices in simple Bangla.	Entrepreneurs send messages.
6	Escalation is created.	AI suggests responsible agency and escalation.	Entrepreneur or supervisor confirms.
7	Supervisor reviews delayed cases.	AI groups delays by center, service and agency.	The supervisor follows up with the responsible agency.

AI-in-action moments

- AI delay detection
- AI API/manual status check support
- AI escalation recommendation
- AI agency routing suggestion
- AI citizen delay message
- AI supervisor pattern analysis

Journey 6: Missing Document Journey

Additional Document Required → Citizen Notified → Case Resubmitted

Scenario: Service portal says an additional document is required.

Step	User Action	AI Intervention	Human Decision / Control
1	Entrepreneur checks case status.	AI interprets technical status from a portal.	Entrepreneur confirms status.
2	The system says the document is missing.	AI identifies missing document types and explains it simply.	The entrepreneur verifies requirements.
3	Citizens must be informed.	AI generates Bangla messages listing the required document.	Entrepreneur reviews before sending.
4	Citizen submits missing document.	AI checks whether uploaded document type matches requirement, if document recognition is available.	Entrepreneur confirms document quality.
5	Entrepreneur resubmits case.	AI updates follow-up date and status.	Entrepreneur completes resubmission.
6	Communication history updated.	AI summarizes what was requested and when.	The record remains auditable.

AI-in-action moments

- AI status interpretation
- AI missing-document explanation
- AI Bangla document request message
- AI document-type support
- AI follow-up rescheduling
- AI communication summary

Journey 7: Assisted Service Authorization Journey

Citizen Needs Help → Authorized Person Receives Updates

Scenario: Elderly citizen authorizes a family member to receive updates.

Step	User Action	AI Intervention	Human Decision / Control
1	The citizen arrives with an assistant/family member.	AI suggests assisted-service mode.	Entrepreneur confirms with citizens.
2	Entrepreneur records who is assisting.	AI prompts for relationship, authorization scope, and preferred channel.	Citizens give consent.
3	Authorization scope is selected.	AI warns if payment updates or document collection require explicit consent.	Entrepreneur records correct scope.
4	A case is created.	AI ensures the authorized recipient is linked to the case.	Entrepreneurs save records.
5	Future update is needed.	AI checks whether the recipient is authorized before generating a message.	The entrepreneur sends only to approved people.
6	Supervisor audits case.	AI shows consent and communication trail.	The supervisor checks compliance if needed.

AI-in-action moments

- AI assisted-mode prompt
- AI consent-field guidance
- AI authorization-scope warning
- AI recipient validation
- AI communication compliance check
- AI audit trail support

Journey 8: Citizen Query Through WhatsApp or Chatbot

Citizen Asks → AI Understands → Case Matched → Update Sent

Scenario: Citizen asks through WhatsApp: “আমার আবেদন কোথায়?”

Step	User Action	AI Intervention	Human Decision Control
1	Citizens send WhatsApp or chatbot messages.	AI detects intent: service status query.	No humans are needed yet.
2	Citizens give phone numbers or case ID.	AI matches the query to correct the case.	If uncertain, the entrepreneur is asked to verify.
3	AI checks authorization.	AI confirms whether the sender is a citizen or authorized recipient.	Unauthorized users receive limited responses.
4	AI reads case status and payment status.	AI creates simple response combining both status and payment information.	Entrepreneur approval can be required for sensitive cases.
5	Citizens receive updates.	AI logs messages in communication history.	Entrepreneurs can review later.
6	The case has a problem.	AI flags entrepreneurs if delayed payment, or missing document exists.	Entrepreneurs follow up.

AI-in-action moments

- AI intent recognition
- AI case matching
- AI authorization check
- AI service and payment status synthesis
- AI citizen response generation
- AI issue flagging

Journey 9: Supervisor Integrity Monitoring Journey

Fee Complaints → Pattern Detected → Review and Action

Scenario: Supervisor sees repeated complaints about unclear fees.

Step	User Action	AI Intervention	Human Decision / Control
1	The supervisor opens the dashboard.	AI highlights centers with unusual payment or fee patterns.	Supervisor reviews.
2	One center has repeated complaints.	AI compares official fees, service charges, receipts, and dispute records.	Supervisor opens center profile.
3	AI shows risk indicators.	Examples: missing receipts, high service charge variation, repeated disputes cases without payment reference.	Supervisor reviews evidence.
4	Supervisor opens sample cases.	AI summarizes each risky case.	The supervisor decides whether to request an explanation.
5	Supervisor sends clarification request.	AI drafts messages to entrepreneurs or local authorities.	Supervisor approves and sends.
6	The case is resolved or escalated.	AI tracks response timelines and unresolved cases.	Supervisor closes or escalates.

AI-in-action moments

- AI integrity risk detection
- AI fee-pattern analysis

AI missing receipt detection
AI case summarization
AI clarification draft
AI unresolved-risk tracking

Journey 10: Offline / Low-Connectivity Journey

Case Created Offline → Synced Later → Citizen Updated

Scenario: The center has an unstable internet.

Step	User Action	AI Intervention	Human Decision / Control
1	Entrepreneurs turn on low-connectivity mode.	AI simplifies the form to capture only essential data.	An entrepreneur starts a case.
2	Citizen and service details are recorded offline.	AI stores the case as draft and marks pending sync.	Entrepreneur confirms data.
3	Payment cannot be verified immediately.	AI marks payment as “Pending verification,” not “Paid.”	Entrepreneurs explain to citizens.
4	Connectivity returns.	AI prompts entrepreneurs to sync cases and complete portal submission.	The entrepreneur submits officially.
5	Tracking number is added.	AI checks missing fields before final save.	Entrepreneur completes record.
6	Citizens need confirmation.	AI generates delayed submission payment confirmation messages.	The entrepreneur sends updates.
7	Supervisor monitors offline cases.	AI shows offline-created, synced, and unsynced cases.	Supervisor follows up if cases remain unsynced.

AI-in-action moments

- AI low-connectivity form simplification
- AI pending-sync tracking
- AI payment verification warning
- AI missing-field check
- AI delayed confirmation message
- AI offline-case monitoring

Journey 11: Refund / Dispute Journey

Failed Payment → Citizen Reports Deduction → Refund Tracked

Scenario: Citizen says money was deducted even though payment failed.

Step	User Action	AI Intervention	Human Decision / Control
1	Citizen reports payment problem.	AI detects issues such as payment disputes.	Entrepreneur opens case.
2	Entrepreneur records transaction ID and provider.	AI checks whether a case already has a related failed or pending payment.	Entrepreneur confirms evidence.
3	AI classifies dispute type.	Example: “failed payment with reported deduction.”	Entrepreneur confirms classification.
4	Complaint reference is created.	AI recommends an escalation route: payment provider, gateway, agency, or supervisor.	Entrepreneur submits escalation.
5	Citizens need acknowledgement.	AI generates Bangla dispute acknowledgement messages.	Entrepreneurs send messages.
6	Refund status changes over time.	AI tracks refund timeline and flags overdue cases.	The supervisor follows up.
7	Refund completed.	AI generates closure messages and asks for citizen feedback.	Entrepreneur closes case.

AI-in-action moments

- AI dispute intent detection
- AI payment-history comparison
- AI dispute classification
- AI escalation route recommendation
- AI refund timeline monitoring
- AI citizen message generation
- AI closure and feedback prompt

Journey 12: Proactive Follow-Up Journey

AI Identifies Cases → Entrepreneur Sends Updates Before Citizen Returns

Scenario: Entrepreneur has many active cases and forgets manual follow-up.

Step	User Action	AI Intervention	Human Decision / Control
1	The system scans active cases daily.	AI identifies which cases need citizen update.	Entrepreneur sees list.
2	Dashboard shows “Updates due today.”	AI prioritizes by delay, payment issue, expected completion date and citizen urgency.	Entrepreneur opens list.
3	AI prepares draft messages.	Messages are customized by case status and payment status.	Entrepreneur reviews.
4	Entrepreneurs send messages in bulk.	AI checks for missing authorization before sending.	The entrepreneur approves sending.
5	Messages are sent.	AI logs communication history automatically.	Entrepreneurs can view delivery status.
6	Follow-up dates are recalculated.	AI recommends the next follow-up schedule.	The entrepreneur accepts or adjusts.
7	Supervisor monitors communication performance.	AI calculates the percentage of cases updated on time.	Supervisor supports low-performing centers.

AI-in-action moments

- AI daily case scanning
- AI update prioritization
- AI bulk message drafting
- AI authorization check
- AI communication logging
- AI follow-up recalculation
- AI performance monitoring

Consolidated AI Intervention Map Across Journeys

AI Intervention	Appears in Which Journeys	What It Does
Intent recognition	2, 8, 11	Understands whether citizen is asking about service, payment, refund, document, or delay
Case matching	2, 8	Finds the correct case from partial information
Service status interpretation	1, 5, 6, 8	Converts portal status into plain language
Payment status interpretation	2, 3, 4, 8, 11	Explains paid, pending, failed, refunded, disputed, unreconciled
Fee explanation	1, 9	Explains official fee, service charge, and total payable
Duplicate/anomaly detection	4, 9	Flags duplicate payments, missing receipts, unusual charges
Bangla message generation	All major journeys	Creates citizen-friendly updates
Follow-up scheduling	1, 5, 6, 12	Suggests next check date
Escalation recommendation	2, 5, 9, 11	Suggests when and where to escalate
Communication summarization	6, 9, 11	Summarizes past messages and actions
Authorization checking	7, 8, 12	Ensures updates go only to approved recipients
Supervisor insight generation	4, 5, 9, 10, 12	Shows patterns across centers, service payments, and complaints

14. Example User Journeys for Prototype

Journey A: Assisted KYC and Document Vault

Citizen visits Digital Center → AI detects service intent → entrepreneur searches/creates citizen profile → consent is recorded → AI shows required documents → citizen provides documents → AI checks completeness and quality → documents are saved in vault → AI links child with

guardian → AI confirms service readiness → draft service case is prepared → citizen receives Bangla confirmation.

Journey B: Service Submitted and Payment Successful

Citizen requests service → entrepreneur selects service → AI shows fee, documents, and timeline → application is submitted → tracking number is recorded → payment is made → AI records payment reference → AI generates Bangla confirmation → follow-up date is scheduled → completion message is sent.

Journey C: Payment Pending

Citizen reports money deducted → AI detects payment issue → AI matches case → payment shown as pending → AI recommends verification → entrepreneur checks payment provider → AI drafts citizen update → unresolved case enters monitoring queue → supervisor sees pending payment cases.

Journey D: Delayed Service

Expected completion date passes → AI flags delay → entrepreneur checks status → AI recommends escalation → delay notice is sent to citizens → supervisor sees delayed cases by center and agency.

Journey E: Proactive Status Communication

AI scans active cases daily → identifies citizens needing updates → drafts messages → checks authorization → entrepreneur reviews and sends → system logs communication → AI recommends next follow-up.
